

MegaClust

Enabling flow cytometry data analysis

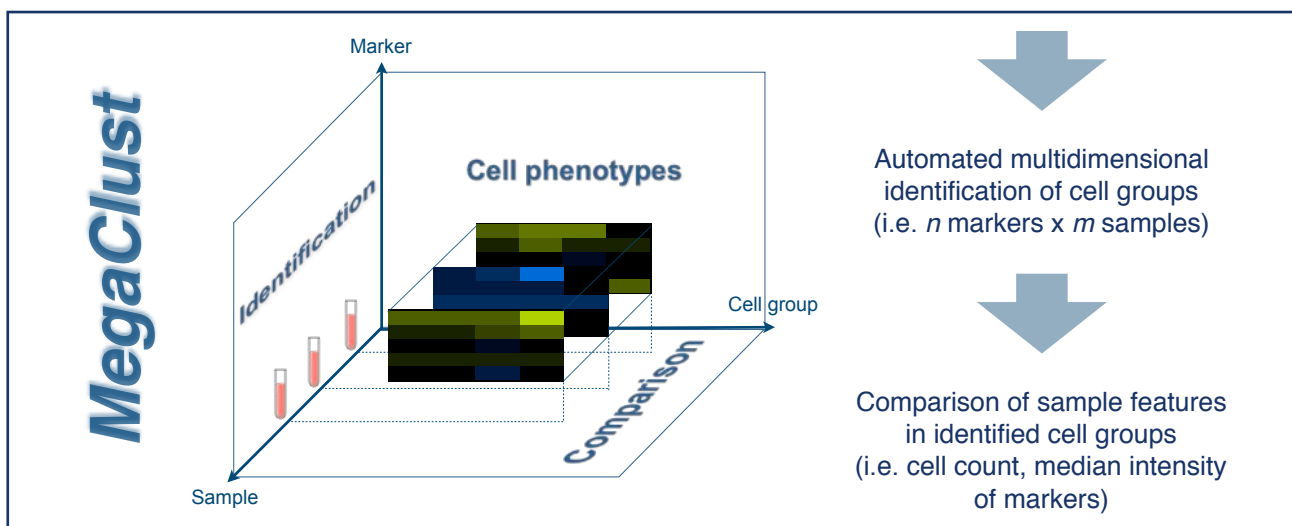

MegaClust is a service allowing companies to analyze their flow cytometry datasets

MegaClust performs an exhaustive and unbiased identification of cell groups in flow cytometry datasets consisting of multiple samples. It provides a powerful way to:

- ➔ Stratify individuals in a cohort and provide insight on the stratification at the functional level
- ➔ Analyze variations in cell subpopulations upon combined stimulations and candidate treatments, thus providing an insight on their mechanism of action and pharmacodynamics

Pooling of acquisition data and submission to MegaClust

Interpretation of results
